

Zuordnung DK- und ESP-Hebel mit Gradscheiben

Post by “Immelmann59” of Sep 27th 2024, 12:28 pm

I have built my own of two 360 degree sensors of the type that is used in cars today and a Arduino CPU with a LED display. The program has the settings for both W128 and W111.

I attach the sensors on respectively axle and slowly increase the pedal. When a measuring point is reached the software reads the position on the ESP.

After all positions is read it will create a report in a plain text file.
